GOVERNMENT OF ANDHRA PRADESH

Chief Minister's Office - AP IAS Performance Tracking System

GoI Funds Score

How well an officer utilised Government-of-India Centrally-Sponsored-Scheme (CSS) funds - spending them well, fully and promptly, with larger funds held for longer counting for more.

AUE 50% - FUE 30% - FTE 20% x day-prorated fund-size difficulty factor

A plain-language note - every formula matches the live calculation.

1 What this score measures

The Government of India releases money to the States for Centrally-Sponsored Schemes (CSS) - schemes jointly funded by the Centre and the State. Whether that money actually reaches the ground and is spent well is a core test of administration. The GoI Funds Score rates exactly this: a high score means the funds were efficiently spent, fully transferred onward, actually expended, and not left lying idle. Managing a larger fund earns a higher difficulty factor.

The five money figures for each scheme

GoI Allocation	the amount the Centre earmarked for the STATE for the scheme.
Funds Transferred	the amount the Centre actually released to the state.
Funds with Agencies	money in hand with the implementing agencies = the amount transferred PLUS any earlier balance they already held.
Expenditure	the amount actually spent on the ground.
Untapped funds	DERIVED = Allocation - Transferred. GoI money not yet drawn down (still at the Centre).

How an officer earns marks - the three kinds of post

An IAS officer rarely stays in one chair for the whole report period. They move through several posts, one after another, and occasionally hold two responsibilities at the same time. Every post record in the system carries a tag called the OFFICE STATUS. This tag is the single most important switch in the whole calculation, because it decides WHICH piece of real-world data is credited to that post. There are exactly three kinds:

- DISTRICT post - the officer heads a district (e.g. District Collector & Magistrate). The post is matched to that DISTRICT's data. The match key is the post's 'office location' field, which holds the district name.
- SECRETARIAT post - the officer heads a department at the State Secretariat (e.g. Principal Secretary, Special Chief Secretary). The post is matched to that DEPARTMENT's data, using the post's 'department' field.
- HoD post - the officer is the Head of a Department or a field organisation (e.g. Commissioner, Director, Director-General). The post is matched to that HoD's data, using the post's 'HoD' field.

A fourth possibility, 'Unmapped', occurs when a post has no usable office status (for example a training stint or a leave period). Unmapped posts carry no data and simply do not contribute to the score - they are neither rewarded nor penalised.

> *In plain words: the same officer can collect marks from a district while serving as Collector, from a department while serving as Secretary, and from a field office while serving as HoD. Each chair is judged only on the data belonging to that chair.*

Proportionate days - why a longer posting counts for more

A post held for eleven months clearly deserves more weight than a post held for eleven days. If we treated every post equally, a one-week acting charge could swing an officer's whole score. To prevent this, each post is given a WEIGHT equal to the number of days it was held - its tenure days.

PROPORTIONATE (TENURE) DAYS

```
tenure days = (last day held) - (first day held) + 1

If the post is still running, 'today' is used as the last day.
A one-day charge therefore weighs 1; a full year weighs 365/366.
```

When several posts are combined into one number, each post's result is multiplied by its tenure days, the products are added, and the total is divided by the total days. This is the DAYS-WEIGHTED AVERAGE - the same arithmetic as a weighted average (below), with days playing the role of the weights.

DAYS-WEIGHTED AVERAGE

```
                SUM ( post result x tenure days )
officer value = -----------------------------------
                       SUM ( tenure days )
```

Counting each calendar day exactly once (overlap merge)

Data-entry sometimes records the same posting in two over-lapping rows, or two genuine stints that touch each other (end on Monday, restart on Tuesday). If we simply added the day counts we would count some calendar days twice and inflate the weight unfairly. So before any counting, the date ranges of the SAME post are MERGED: over-lapping or back-to-back ranges are fused into one continuous range (a gap of one day or less is treated as continuous). A day on which the officer held the post therefore counts once - never twice, never zero.

2 The three efficiency indicators

For Secretariat and HoD posts - which actually manage scheme funds - three ratios are computed. Each is turned into a percentage and CAPPED to the 0-100 range so a single unusual ratio cannot distort the blend. There is no separate 'untapped' indicator: since Untapped = Allocation - Transferred, it is already captured by FTE below.

- AUE - Allocation Utilisation Efficiency = Expenditure / GoI Allocation x 100 (weight 50%). Of all the Centre earmarked for the state, how much actually got spent? The headline outcome.
- FUE - Fund Utilisation Efficiency = Expenditure / Funds-with-Agencies x 100 (weight 30%). Of the money in the agencies' hands, how much was actually put to work?
- FTE - Fund Transfer / Drawdown Efficiency = Funds Transferred / GoI Allocation x 100 (weight 20%). How much of the allocation was drawn down? Because Untapped = Allocation - Transferred, FTE = 100 - Untapped/Allocation x 100, so a high FTE already means little untapped money.

PER-POST GoI EFFICIENCY

```
post efficiency (Secretariat / HoD) =
      0.50 x AUE + 0.30 x FUE + 0.20 x FTE
(each indicator first capped to the 0 - 100 range)
```

District posts use a single indicator

A District post reports only 'funds available' (the district's money in hand with agencies) and 'expenditure', so it is scored on a single ratio: District Utilisation = Expenditure / Funds Available x 100 - the district counterpart of FUE. The same capping applies.

3 The officer's GoI Funds score

Each post's efficiency is combined by the days-weighted average (a longer posting counts more) to give the officer's overall efficiency. Then a difficulty factor, based on a DAY-PRORATED volume of funds the officer handled, multiplies it.

DAY-PRORATED FUND VOLUME

```
day-prorated volume  V =
   SUM over posts ( fund managed in post  x  min(1, days in post / 365) )

fund managed = GoI Allocation (Sec/HoD)  or  Funds Available (District)
```

The min(1, days/365) term is the day-proration: a post held the whole year contributes its whole fund; a post held 73 days contributes only 73/365 = 0.20 of it. So the volume - and the score - grows with BOTH the fund size and the days actually served.

The difficulty (load) factor - rewarding a heavier burden

Two officers may both be 90% efficient - but one cleared a tiny in-tray while the other ran a giant one; one managed a small grant while the other managed a huge one. Calling them equal would be unjust. So the efficiency is MULTIPLIED by a difficulty factor that grows with the size of the load the officer actually carried (the day-prorated volume of GoI funds the officer handled).

DIFFICULTY / LOAD / VOLUME FACTOR

```
difficulty = floor + (1 - floor) x W            (floor = 0.70)

W = log(1 + load) placed on a 0..1 scale between the smallest
    and the largest log-load across all officers.
    W = 0 for the smallest load, W = 1 for the largest.

load basis = the officer's day-prorated GoI fund volume across schemes (rupees crore)
```

Why a logarithm?

A logarithm compresses big numbers so that equal MULTIPLES are equal steps. On a log scale the jump from 1 to 10 is the same size as 10 to 100, and 100 to 1000. We use it so that handling a much larger load is recognised as genuinely harder, WITHOUT letting a single enormous value swamp everyone else (which a plain, straight scale would allow).

> *In plain words: doing a small job perfectly can never out-rank doing a far bigger job equally well. The biggest load earns the full factor of 1.00; the smallest still keeps the floor (e.g. 0.70), so it is dampened but never reduced to zero.*

FINAL GoI FUNDS SCORE

```
Efficiency = days-weighted average of the post efficiencies
Volume     = 0.70 + 0.30 x W   (W = log-scaled day-prorated fund volume)

GoI Funds Score = Efficiency x Volume              (0 - 100)
```

4 Worked example

WORKED EXAMPLE - GoI Funds

Scheme under a Secretary post, held the full year (365 days):
Allocation Rs.100 cr, Transferred Rs.90 cr, with Agencies Rs.80 cr,
Expenditure Rs.72 cr. (Untapped = 100 - 90 = Rs.10 cr, captured by FTE.)

AUE = 72 / 100 x100 = 72.0
FUE = 72 / 80 x100 = 90.0
FTE = 90 / 100 x100 = 90.0
post efficiency = .50x72 + .30x90 + .20x90 = 81.0

Officer efficiency (days-weighted across posts) = 81.0
Held full year -> volume = full Rs.100 cr; large in cohort -> W = 0.90
Volume factor = 0.70 + 0.30x0.90 = 0.97
GoI Funds Score = 81.0 x 0.97 = 78.6

5 The statistics, explained

Ratios and capping

Each indicator is a ratio of two money figures, turned into a percentage. Because of timing (money spent this quarter may exceed what agencies hold this instant), a ratio can legitimately exceed 100. Capping every indicator to 0-100 keeps all three comparable and the blend stable.

The weights as policy

The 50 / 30 / 20 split is a statement of priority: actual spend against the allocation (AUE) matters most; spend against what is in hand (FUE) next; drawing the money down (FTE) last. Untapped money is NOT a separate slice because it is Allocation - Transferred, already inside FTE - adding it again would double-count the same fact. The weights are editable in the Admin Console and the score normalises by their sum, so they need not total exactly 1.00.

Day-proration and the difficulty factor

Posts are blended by tenure days, and the fund volume that feeds the difficulty factor is day-prorated - each post's fund counted only in proportion to min(1, days/365). So an officer who held a large fund for the whole year carries far more volume than one who held it briefly. The difficulty factor (log-scaled, floor 0.70) then makes utilising a large, long-held fund well outrank doing the same with a small or briefly-held one. The log scale makes equal multiples of fund size equal steps.

6 Reading it on the dashboard & FAQ

The GoI Funds page lists each officer's matched posts (unique), the number of distinct schemes, the aggregated allocation / transferred / expenditure, the Score and a state-wide Rank. A drill-down shows each post's No. of Days, schemes and money figures. There is the usual Normalised / Absolute switch.

Q. My AUE is only 60% but I transferred everything. Why is my score not higher?

A. AUE (actual spend vs allocation) carries the most weight - 50%. Drawing money down (FTE) is only 20%. The score rewards money that is SPENT, not merely moved.

Q. Why is there no separate 'untapped' indicator any more?

A. Untapped = Allocation - Transferred, which is exactly what FTE (Transferred / Allocation) already measures. A high FTE means a small untapped pile; a separate term would double-count it.

Q. I ran a big fund well but only for two months. Why is my score modest?

A. The fund volume is day-prorated: two months counts about 60/365 of the fund. The difficulty factor therefore credits you for a smaller volume than a full-year holder of the same fund.

Q. Can an indicator really be over 100%?

A. Yes, due to timing (this period's spend can exceed what agencies hold this instant). Each indicator is capped to 100 so the blend stays fair.

G Glossary of terms

CSS / GoI Funds

Centrally-Sponsored-Scheme money released by the Centre.

GoI Allocation

the amount earmarked for the state for a scheme.

With Agencies

money in hand with agencies = transferred + any earlier balance.

Untapped
Allocation - Transferred; GoI money not yet drawn down.

AUE
Expenditure / Allocation - did the earmarked money get spent.

FUE
Expenditure / Funds-with-Agencies - spend vs what is in hand.

FTE
Funds Transferred / Allocation - drawdown (also captures untapped).

Capping
forcing each ratio into the 0-100 range.

Efficiency
weighted blend of the three indicators (or DUE for districts).

Day-prorated volume
fund x min(1, days/365), summed across posts.

Volume factor
0.70-1.00 multiplier growing with the day-prorated fund volume.

All weights, benchmarks and difficulty-factor floors/ceilings are stored in the score_config table and are configurable by the administrator in the Score-Weights page of the dashboard, so the system can be re-tuned without changing any code. Scores recompute automatically whenever the underlying data changes. Every formula in this note matches the live calculation exactly.
