
GOVERNMENT OF ANDHRA PRADESH

Chief Minister's Office - AP IAS Performance Tracking System

PERFORMANCE SCORE - 3 of 6

Swarnandhra KPI Score

How the district / department / HoD Key-Performance-Indicators of Swarna Andhra Pradesh are attributed to each officer through the posts they held and the time they held them.

Per-post = average of matched KPIs Officer = days-weighted average

A plain-language note - every formula matches the live calculation.

1 What this score measures

Swarna Andhra Pradesh is the State's flagship outcomes programme. It tracks Key Performance Indicators (KPIs) - concrete, measurable targets - for every district, every department and every HoD office. Each KPI is already published on a 0-100 scale, where 100 means the target was fully met. Because the KPI values themselves already capture the quality of the outcome, this score does NOT add any difficulty or volume factor. Its only job is to attribute those ready-made KPI results to the officer who led the place, weighted by how long they led it.

KPI row	one indicator's 0-100 score for a particular district / department / HoD.
Office status	decides whether a post is matched to district, department or HoD KPIs.
Match key	district name (District post), department (Secretariat), or HoD (HoD post).

How an officer earns marks - the three kinds of post

An IAS officer rarely stays in one chair for the whole report period. They move through several posts, one after another, and occasionally hold two responsibilities at the same time. Every post record in the system carries a tag called the OFFICE STATUS. This tag is the single most important switch in the whole calculation, because it decides WHICH piece of real-world data is credited to that post. There are exactly three kinds:

- DISTRICT post - the officer heads a district (e.g. District Collector & Magistrate). The post is matched to that DISTRICT's data. The match key is the post's 'office location' field, which holds the district name.
- SECRETARIAT post - the officer heads a department at the State Secretariat (e.g. Principal Secretary, Special Chief Secretary). The post is matched to that DEPARTMENT's data, using the post's 'department' field.
- HoD post - the officer is the Head of a Department or a field organisation (e.g. Commissioner, Director, Director-General). The post is matched to that HoD's data, using the post's 'HoD' field.

A fourth possibility, 'Unmapped', occurs when a post has no usable office status (for example a training stint or a leave period). Unmapped posts carry no data and simply do not contribute to the score - they are neither rewarded nor penalised.

In plain words: the same officer can collect marks from a district while serving as Collector, from a department while serving as Secretary, and from a field office while serving as HoD. Each chair is judged only on the data belonging to that chair.

Proportionate days - why a longer posting counts for more

A post held for eleven months clearly deserves more weight than a post held for eleven days. If we treated every post equally, a one-week acting charge could swing an officer's whole score. To prevent this, each post is given a WEIGHT equal to the number of days it was held - its tenure days.

PROPORTIONATE (TENURE) DAYS

tenure days = (last day held) - (first day held) + 1

If the post is still running, 'today' is used as the last day.

A one-day charge therefore weighs 1; a full year weighs 365/366.

When several posts are combined into one number, each post's result is multiplied by its tenure days, the products are added, and the total is divided by the total days. This is the DAYS-WEIGHTED AVERAGE - the same arithmetic as a weighted average (below), with days playing the role of the weights.

DAYS-WEIGHTED AVERAGE

$$\text{officer value} = \frac{\text{SUM (post result x tenure days)}}{\text{SUM (tenure days)}}$$

Counting each calendar day exactly once (overlap merge)

Data-entry sometimes records the same posting in two over-lapping rows, or two genuine stints that touch each other (end on Monday, restart on Tuesday). If we simply added the day counts we would count some calendar days twice and inflate the weight unfairly. So before any counting, the date ranges of the SAME post are MERGED: over-lapping or back-to-back ranges are fused into one continuous range (a gap of one day or less is treated as continuous). A day on which the officer held the post therefore counts once - never twice, never zero.

The weighted average - letting important pieces count more

Most scores blend several pieces of evidence. A weighted average lets the more important pieces count more. Give each piece a weight, multiply each piece by its weight, add them all up, and divide by the sum of the weights used.

WEIGHTED AVERAGE

$$\text{weighted average} = \frac{w1.v1 + w2.v2 + \dots + wn.vn}{w1 + w2 + \dots + wn}$$

v = a 0-100 piece (sub-score), w = its weight (importance).

A weight of 0.45 means that piece decides 45% of the result; a weight of 0.10 means only 10%. Dividing by the SUM of the weights actually used is important - it is what lets a missing piece be skipped without distorting the rest.

2 Score of one post

A post is matched - by its office status - to the relevant set of KPI rows: the district's KPIs for a District post, the department's KPIs for a Secretariat post, or the HoD's KPIs for an HoD post. The post's score is the plain (equal-weighted) average of those matched KPI scores.

PER-POST SWARNA SCORE

$$\text{post score} = \frac{\text{sum of the matched KPI scores}}{\text{number of matched KPIs}}$$

(a post that matches no KPI has no score and is simply skipped)

Why a plain average inside a post? Because each KPI is already a calibrated 0-100 outcome measure of equal standing. Averaging them gives one representative number for how that place performed during the officer's charge.

3 The officer's Swarnandhra KPI score

The officer's posts that DID match some KPI are combined with the days-weighted average. A longer posting in a high-KPI place therefore counts far more than a brief one.

OFFICER SWARNA SCORE

$$\text{Swarna Score} = \frac{\text{SUM (post score x tenure days)}}{\text{SUM (tenure days)}} \quad (0 - 100)$$

(only posts that matched some KPI are included in either sum)

4 Worked examples

WORKED EXAMPLE - a two-post officer

Collector of District A (250 days): District-A KPIs = 80, 76, 78 -> average 78.0

Secretary of Dept X (115 days): Dept-X KPIs = 60, 68 -> average 64.0

$$\begin{aligned}\text{Swarna Score} &= (78.0 \times 250 + 64.0 \times 115) / (250 + 115) \\ &= (19500 + 7360) / 365 \\ &= 26860 / 365 = 73.6\end{aligned}$$

WORKED EXAMPLE - why days matter

Same KPI averages (78 and 64) but tenures swapped:

District A only 115 days, Dept X 250 days.

$$\text{Swarna} = (78 \times 115 + 64 \times 250) / 365 = (8970 + 16000) / 365 = 68.4$$

-> The SAME outcomes give a different officer score, because the officer spent more time in the lower-KPI place. Time in charge is everything.

5 The statistics, explained

Averaging the KPIs within a post

All KPIs matched to a post count equally (a plain mean), because each is already a calibrated 0-100 outcome. If a district has many KPIs, the mean is the single fair summary of how that district did. No KPI is allowed to dominate another.

Days-weighting across posts

Across the officer's posts we use a weighted average with TENURE DAYS as the weights. This is the proportionate-days idea: ten months in a district counts far more than ten days. The second worked example above shows how the same outcomes produce a different officer score depending purely on where the officer spent their time.

Why there is no difficulty factor here

Unlike e-Office, GoI Funds and GSDP, the Swarnandhra KPIs already bake outcome quality and ambition into the 0-100 value. Multiplying again by a 'size' factor would double-count difficulty, so this score deliberately stops at the days-weighted average.

6 Reading it on the dashboard & FAQ

The Swarnandhra page lists each officer's posts, the KPI category each matched, the per-post score with from / to dates, the number of posts, the final Swarna Score and a state-wide Rank. Clicking a post opens its periods. A Normalised / Absolute switch is available as on every score page.

Q. I led two high-KPI districts but my score is lower than a colleague's. Why?

A. Check the tenure days - the colleague may have spent more of the year in their high-KPI place. The score is days-weighted, so time in charge is decisive.

Q. A district had ten KPIs and another only two. Does the ten-KPI district count more?

A. Inside a post the KPIs are averaged, so the COUNT of KPIs does not inflate the post score; what matters is the average level and the days you held the post.

Q. Why no difficulty factor like the other scores?

A. The KPI values already express outcome quality on 0-100. Adding a size factor would double-count difficulty.

G**Glossary of terms**

KPI

Key Performance Indicator - a published 0-100 outcome measure.

Per-post score

the plain average of the KPIs matched to that post.

Office status

District / Secretariat / HoD - selects which KPIs a post matches.

Tenure days

days a post was held; the weight in the officer average.

Days-weighted average

weighted average using tenure days as the weights.

All weights, benchmarks and difficulty-factor floors/ceilings are stored in the score_config table and are configurable by the administrator in the Score-Weights page of the dashboard, so the system can be re-tuned without changing any code. Scores recompute automatically whenever the underlying data changes. Every formula in this note matches the live calculation exactly.
