
GOVERNMENT OF ANDHRA PRADESH

Chief Minister's Office - AP IAS Performance Tracking System

PERFORMANCE SCORE - 5 of 6

Public Perception Score

What citizens feel - sentiment from Information & Public Relations citizen surveys, credited to the officer for the district and the time they were actually in charge.

Per-post = average of matching surveys Officer = days-weighted average

A plain-language note - every formula matches the live calculation.

1 What this score measures

Administration ultimately serves citizens, and how citizens FEEL about governance is a performance signal in its own right. The Information & Public Relations (I&PR) department runs citizen surveys - called campaigns - across districts. Each survey returns a sentiment score on a 0-100 scale, higher meaning more positive public opinion. This score credits an officer with the public perception of the district they led - but ONLY for the survey periods that fall within their own tenure there, so nobody is blamed or praised for another's time.

Campaign / Survey	a citizen-feedback exercise carried out in a district.
Sentiment score	the survey's 0-100 result for that district and period.
Survey period	the date range the survey covers - matched against the officer's tenure.
District	the geography; perception is a district-level measure.

How an officer earns marks - the three kinds of post

An IAS officer rarely stays in one chair for the whole report period. They move through several posts, one after another, and occasionally hold two responsibilities at the same time. Every post record in the system carries a tag called the OFFICE STATUS. This tag is the single most important switch in the whole calculation, because it decides WHICH piece of real-world data is credited to that post. There are exactly three kinds:

- DISTRICT post - the officer heads a district (e.g. District Collector & Magistrate). The post is matched to that DISTRICT's data. The match key is the post's 'office location' field, which holds the district name.
- SECRETARIAT post - the officer heads a department at the State Secretariat (e.g. Principal Secretary, Special Chief Secretary). The post is matched to that DEPARTMENT's data, using the post's 'department' field.
- HoD post - the officer is the Head of a Department or a field organisation (e.g. Commissioner, Director, Director-General). The post is matched to that HoD's data, using the post's 'HoD' field.

In plain words: the same officer can collect marks from a district while serving as Collector, from a department while serving as Secretary, and from a field office while serving as HoD. Each chair is judged only on the data belonging to that chair.

Proportionate days - why a longer posting counts for more

A post held for eleven months clearly deserves more weight than a post held for eleven days. If we treated every post equally, a one-week acting charge could swing an officer's whole score. To prevent this, each post is given a WEIGHT equal to the number of days it was held - its tenure days.

PROPORTIONATE (TENURE) DAYS

$$\text{tenure days} = (\text{last day held}) - (\text{first day held}) + 1$$

If the post is still running, 'today' is used as the last day.

A one-day charge therefore weighs 1; a full year weighs 365/366.

When several posts are combined into one number, each post's result is multiplied by its tenure days, the products are added, and the total is divided by the total days. This is the DAYS-WEIGHTED AVERAGE - the same arithmetic as a weighted average (below), with days playing the role of the weights.

DAYS-WEIGHTED AVERAGE

$$\text{officer value} = \frac{\text{SUM (post result x tenure days)}}{\text{SUM (tenure days)}}$$

Counting each calendar day exactly once (overlap merge)

Data-entry sometimes records the same posting in two over-lapping rows, or two genuine stints that touch each other (end on Monday, restart on Tuesday). If we simply added the day counts we would count some calendar days twice and inflate the weight unfairly. So before any counting, the date ranges of the SAME post are MERGED: over-lapping or back-to-back ranges are fused into one continuous range (a gap of one day or less is treated as continuous). A day on which the officer held the post therefore counts once - never twice, never zero.

2 Score of one post

For a district post the system selects the survey rows for THAT district whose survey period overlaps the officer's tenure in the post, and averages their sentiment scores. That average is the post's perception score. The period match is the careful part: an officer is judged only on the public mood DURING their own charge - surveys before they arrived or after they left are excluded.

PER-POST PERCEPTION SCORE

post score = average sentiment of the matching survey rows

matching = (correct district) AND
(survey period overlaps the officer's tenure)

3 The officer's Public Perception score

The posts that matched surveys are combined by the days-weighted average, so a longer stint in a district counts proportionally more. Posts that matched no survey are skipped.

OFFICER PERCEPTION SCORE

$$\text{Perception Score} = \frac{\text{SUM (post score x tenure days)}}{\text{SUM (tenure days)}} \quad (0 - 100)$$

In plain words: an officer is judged on public mood only for the PLACE and the TIME they were actually in charge, and a longer tenure carries more weight.

4 Worked example

WORKED EXAMPLE - Public Perception

Collector of District A, tenure Jan-Sep (260 days).

District-A surveys whose period falls in Jan-Sep: 72, 75, 78 -> average 75.0

Collector of District B, tenure Oct-Dec (92 days).

District-B surveys in Oct-Dec: 66 -> average 66.0

$$\begin{aligned} \text{Perception Score} &= (75.0 \times 260 + 66.0 \times 92) / (260 + 92) \\ &= (19500 + 6072) / 352 \\ &= 25572 / 352 = 72.6 \end{aligned}$$

5 The statistics, explained

Averaging survey rows

Several surveys may cover one district during a single tenure; their plain mean gives one representative sentiment for that post. Each survey is already a calibrated 0-100 measure, so equal weighting within a post is appropriate.

Period matching - attributing mood to the right person

Only surveys whose period overlaps the officer's tenure are counted. This is what stops an officer from inheriting a predecessor's good (or bad) reputation, or being credited for a successor's. It ties the public mood to the exact window the officer was responsible.

Days-weighting across posts

As with the other tenure-based scores, posts are blended using tenure days as the weights, and over-lapping stints are merged first so no calendar day is counted twice.

Why perception has no difficulty factor

Public sentiment is already an outcome on a 0-100 scale; there is no natural 'size of load' to scale it by, so the score stops at the days-weighted average - exactly like the Swarnandhra KPI score.

6 Reading it on the dashboard & FAQ

The Public Perception page lists each officer's posts, the campaigns matched, the per-post score with from / to dates, the number of posts, the Perception Score and a state-wide Rank. Clicking a post opens its periods. The Normalised / Absolute switch is available as elsewhere.

Q. A bad survey was taken just before I took charge. Does it count against me?

A. No. Only surveys whose period overlaps YOUR tenure are counted; earlier ones belong to your predecessor's record.

Q. I served in two districts. How are they combined?

A. Each district post gets its own average from its matching surveys; the two are then blended by your tenure days in each.

Q. My district had no survey during my time. What happens?

A. That post simply has no perception score and is skipped - it neither helps nor hurts your overall Perception Score.

G Glossary of terms

Campaign / Survey

an I&PR citizen-feedback exercise in a district.

Sentiment score

the survey's 0-100 result.

Survey period

the date range a survey covers.

Period matching

counting a survey only if its dates overlap the officer's tenure.

Per-post score

average sentiment of the post's matching surveys.

Days-weighted average

weighted average using tenure days as the weights.

All weights, benchmarks and difficulty-factor floors/ceilings are stored in the score_config table and are configurable by the administrator in the Score-Weights page of the dashboard, so the system can be re-tuned without changing any code. Scores recompute automatically whenever the underlying data changes. Every formula in this note matches the live calculation exactly.
